

IRON PROGRAM

Strategies

1. Iron Train System

Indicators / Tools

1. Iron Levels
2. Quick Trailing
3. Iron Harmonic
4. MEGAWY
5. Iron Trendline Break
6. Iron Chromatine
7. Iron Mantra

Forex EA Robots

1. GPS Robot FxChoice 3.0
2. FxCharger Max 2.3
3. EA Happy Gold 1.7
4. SkyBlue 1.4
5. Forex Cyborg 1.2
6. Iron Trading EA

Complete Iron Course

1. Wolfe Waves
2. Price Action Basic
3. Price Action Advanced
4. Volume Profile
5. Candlestick Patterns
6. Trading Psychology

More information about the Program: <https://www.irontradingfx.com/iron-program>

Our performance: <https://www.irontradingfx.com/performance>

Will this Program turn you into a professional trader?

It normally does. The most of our students become profitable traders after finishing our Program. Actually, some of them only use the Iron Train System and some of our indicators and make a lot of profits every month (although we strongly recommend you to study the Course to understand the markets and manage every situation).

Will you lose money during the practice period?

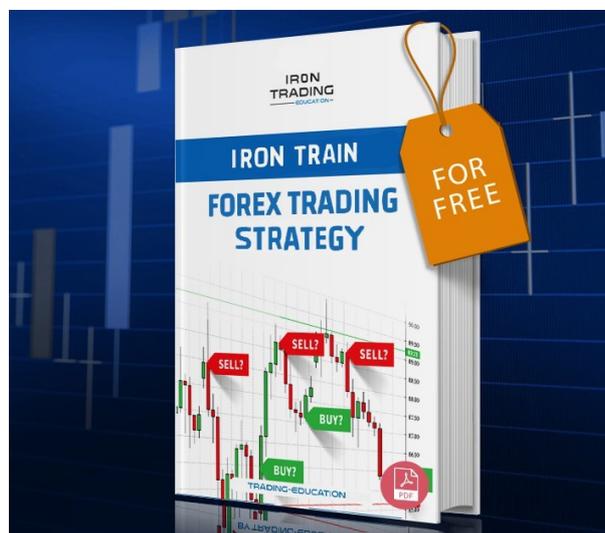

To avoid this, we send you our **Iron Train System** (our best) **from the beginning**. Of course it takes some practice to master it, but you shouldn't lose if you follow it and control your lotsize. If you end up losing a little bit for any reason we will try to **cover your losses** if possible, although this rarely occurs. The Iron Program only takes **2-3 weeks** normally.

IRON TRAIN SYSTEM

It took us three years to develop our best strategy. Incredibly effective, mechanical and suitable for every level of trader (you don't need to know how the markets works to use it). Actually, you only need this strategy and our indicators to make a living from trading, it doesn't matter your previous level or experience.

It's basically a system designed to help the trader to jump onto a trend at the best possible moment. It always goes with the trend and provides entries of at least 1:2 ratio, but normally much higher. If applied correctly, **it has a success rate of at least 75-80%**.

We provide a complete description of the system rules, examples and exercises.

INDICATORS / TOOLS

Self-made and very effective. An incredibly useful support for your trades.

IRON LEVELS

Indicator that shows the daily algorithmic key levels of each instrument, the levels that the EA's consider. It can be used to foresee rebounds or calculate safe entry points at pullbacks and throwbacks. You will see that, when the price reaches one of these levels, there is normally a reaction. And if one of the levels overlaps with a strong support or resistance, the guarantee doubles.

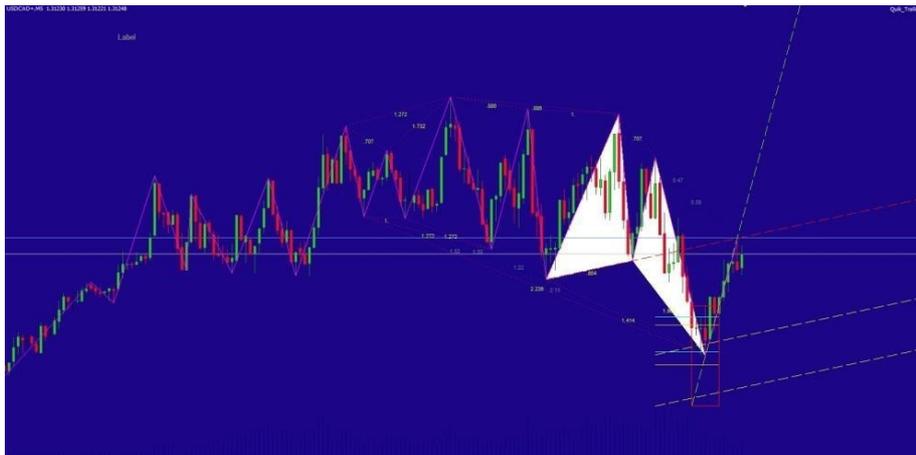

QUICK TRAILING EA

This amazing EA is programmed to tell you exactly where you need to open and close the trade according to the size of your account and the money you want to make per trade. You can have the best strategy or the best knowledge of the market, but if you fail at risk management, you will inevitably end up losing your account. Quick Trailing will help you to avoid that by directing your entries.

IRON HARMONIC

Harmonic patterns construct geometric pattern structures (retracement and projection swings/legs) using Fibonacci sequences. These harmonic structures identified as specified (Harmonic) patterns provide unique opportunities for traders with potential price movements and key turning or trend reversal points. This factor adds an edge for traders as Harmonic patterns attempt to provide highly trustful price entries, stops and targets information. This indicator is an Harmonic Pattern detector.

MEGAWY

Indicator that detects when a trend is going to change with a great percentage of success. It is based on Price Action structures, Candlestick patterns and Heikin Ashi candles. It can be a very strong tool if used in combination with the other material included in the package.

IRON TRENDLINE BREAK

Indicator that paints the real trendlines and tells you (with an alarm system) when a trendline has been broken. As you know, the main foundation of our method is Price Action, so we are always looking for trendline breaks and confirmations. That's why this tool is so useful: not only because the alert factor, also because it may detect trendline breaks that you may have overlooked.

IRON CHROMATINE

We designed this indicator introducing volume and pattern algorithms. It helps to determine the zones and the moments when a trend is weakening. It can work very well in combination with the other tools, the knowledge of the Courses and your own experience.

IRON MANTRA

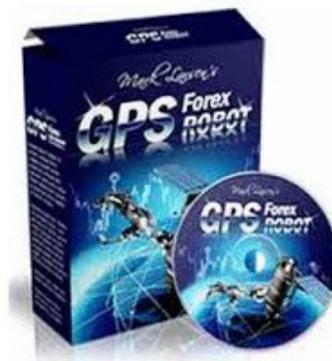

This indicator has a similar formula to Iron Levels, but it follows the price, creating a channel that represents the control zones of the counterparties at that moment. At the bottom of the channel, there are more buy limit orders than sell orders, and vice versa. The channel will normally be respected and the price will bounce from one side to the other.

FOREX EA ROBOTS

IRON TRADING EA

This EA hasn't been tested yet, as it is new. It contains all the parameters of our trading methods, so the performance will be very similar to ours.

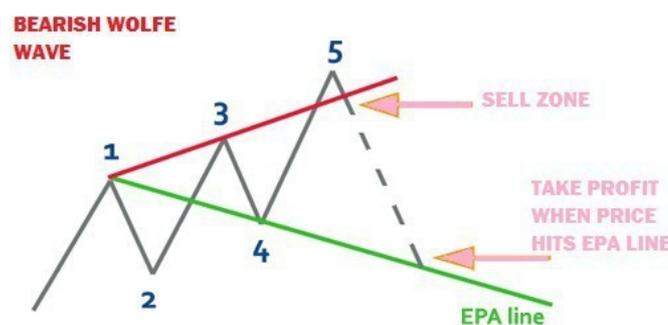

Check performance: <https://www.irontradingfx.com/performance>

COMPLETE IRON COURSE

We have condensed all the knowledge we have acquired during our 11 years of experience into this Trading Course. It is important to point out that **this is not just theory that you can find online, this is our personal perspective of each field.** We have got rid of all the useless parts and developed everything that actually works, mixing it with multiple elements. The result is a very complex system, but actually very easy to understand and master.

WOLFE WAVES

Wolfe Waves are an advanced Technical Analysis figure that detects the immediate changes of tendency, with high probability of success. Suitable for every Time Frame (from 1 Min to Monthly) and all the instruments (indices, forex, stocks, metals ...), the Wolfe Wave approach, once it is mastered, is a very convenient system to trade, since it defines a Stop Loss and Take Profit zone very clearly, without the need of being permanently in front of the screen. We will teach you all we know about them, which happens to be a pretty different approach to the usual.

PRICE ACTION

Price action is the analysis of the price movement of a market over time. By learning to read the price action of a market, we can determine a market's directional bias as well as trade from reoccurring price action patterns or price action setups that reflect changes or continuations in market sentiment. We consider it the best way, together with volume, to detectar the traces of the professional traders, the ones who move the market, and follow them when they execute their strategies. We will learn:

- The representation of the price in its different forms: candles, bars, thread.
- The representation of the price and structures by means of Japanese candles.
- Trend, the direction of money and the professional.
- As price structures are formed, we will learn how to read the price.
- Paper areas, money areas, phases of bullish and bearish price development.
- Channeling, trend lines, guidelines.
- Startup module, failure and turnaround for a new price structure.
- The triple pattern, the rule of 3.
- Analysis of the study of the different waves, always under our own vision.
- Gap study: the different types and their nature.
- Detecting and interpreting the different patterns of exhaustion and continuity outside the common theoretical context, always with the help of Volume Profile and VSA.
- Fractals and symmetries. How to help us and in what way with the use of other assets to intuit future price developments.
- Management of positions, inputs and outputs (Input, Stop, Profit).
- Operational route map, know where we are and what patterns / strategies to use in each phase of the market. We structure the price to have a guide on how to start and end an analysis with each price structure, both intraday and operational Swing in different assets that are traded.

VOLUME PROFILE

Volume is a measure of how much of a given financial asset has been traded in a given period of time. It is a very powerful tool but is often overlooked because it is such a simple indicator. Volume information can be found just about anywhere, but few traders or investors know how to use this information to increase their profits and minimize risk. We consider it the best way, together with price action, to detect the traces of the professional traders, the ones who move the market, and follow them when they execute their strategies. We will learn:

- The complete study of the Volume regarding the movement in the price, we will deepen in its analysis complementing it with the use of: Clusters, VPOC'S of candle, accumulation, distribution, absorption, tests, no demand, no offer, volumes of rapture, climax ...

- Volume Profile: Volume in price and its study in different TF's (VPOC, VA, HVM, LVN) as well as its integration with the VSA.
- Market Profile: Time Price Opportunities (TPO), different openings (open drive, test drive, rejection, auction).
- Pattern strategies through the use of: Price / VSA / Volume Profile / Clusters

CANDLESTICK PATTERNS

Candlestick charts originated in Japan over 100 years before the West developed the bar and point-and-figure charts. In the 1700s, a Japanese man named Homma discovered that, while there was a link between price and the supply and demand of rice, the markets were strongly influenced by the emotions of traders. Candlesticks show that emotion by visually representing the size of price moves with different colors. Traders use the candlesticks to make trading decisions based on regularly occurring patterns that help forecast the short-term direction of the price. This Course:

- Details the most valuable aspect of technical analysis-reversal patterns-as well as reversal signals, including the Doji, the Hammer, the Hanging Man, Engulfing Patterns, and Dark Cloud Cover, always under our point of view, shaped through years of experience.
- Explains continuation patterns and explores how they can help with the decision-making process during various trading periods.
- Reveals how to find trading situations that have the maximum potential for profitability, the highest probability of success, and the least amount of risk.

TRADING PSYCHOLOGY

The psychological aspect of trading is extremely important. Traders often dart in and out of stocks on short notice, necessitating quick decisions. To accomplish this, they need a certain presence of mind. They also, by extension, need discipline, so they will stick with previously established trading plans and know when to book profits and losses. Emotions simply can't get in the way.

When a trader gets bad news about a certain stock or the general market, it's not uncommon for the trader to get scared. They may overreact and feel compelled to liquidate their holdings and go to cash or to refrain from taking any risks. If they do that, they may avoid certain losses, but they also may miss out on gains.

Traders need to understand what fear is: a natural reaction to what they perceive as a threat, in this case, to their profit or money-making potential. Quantifying the fear might help, and traders should consider pondering what they are afraid of, and why they are afraid of it.

There's an old saying on Wall Street that "pigs get slaughtered." This adage refers to greedy investors hanging on to winning positions too long, trying to get every last tick. Greed can be devastating to returns, because a trader always runs the risk of getting whipsawed or blown out of a position.

Greed is not easy to overcome. It's often based on an instinct to try to do better, to try to get just a little more. A trader should learn to recognize this instinct and develop a trading plan based upon rational business decisions, not emotional whims or potentially harmful instincts.

Emotions are usually underestimated in the trading world. In this Course, we will learn how to master them, which we consider the 60% of the trading skills.
